STRATEGY / EXPERIENCE / BOOKING ENGINE / AGENT DELIVERY

Complete MVP Product Requirements & Validation

Exclusive full-property bookings for resort stays and private events

PROJECT	PLATFORM	RELEASE
V-Farms Five-acre dragon fruit farm, Hyderabad Five guest rooms in one building	**v0 + Cursor + Next.js** Supabase + Razorpay + Vercel	**Specification V1.1** 12 October 2026 Product scope corrected for exclusive whole-estate booking

NON-NEGOTIABLE PRODUCT RULE

V-Farms is booked as one exclusive property. Guests cannot reserve or pay for individual rooms. Two routes are supported: an overnight **STAY** and an exclusive **EVENT** booking.

Intended readers: product owner, AI coding agents, UX agents, solution architect, QA lead and launch operator. This is a **no-code specification**, not an implemented application.

CHAPTER 01 / V-FARMS PRODUCT BLUEPRINT

Executive product definition

The contract every design and coding agent must follow.

CONFIRMED FACT	PRODUCT IMPLICATION
Name: **V-Farms**.	Use V-Farms across all public pages, messages, receipts and admin views.
Location: near/in Hyderabad, Telangana.	Indian rupee pricing and Asia/Kolkata time zone; exact postal address pending.
Five-acre dragon fruit farm.	Plantation, farm story and site map are key differentiators.
Five different rooms in **one building**.	Show all five room profiles in the resort tour; none has an individual booking CTA.
One booking covers **the entire resort**.	Maintain one property-level availability source of truth for both stays and events.

Success definition

- A guest can understand the property, examine the five included rooms and book an entire-resort stay for available dates.
- An event organizer can request an exclusive event date, obtain an approved quote, accept rules and pay a deposit online.
- The owner can see one unified calendar, prevent conflicts, manage rates/quotes/bookings, record payments and publish authentic farm content.
- Every confirmed reservation is backed by validated availability and verifiable payment or an explicitly authorized manual confirmation.

OUT OF SCOPE: ROOM-WISE BOOKINGS

Previous five-room booking prototypes and room-level availability logic are superseded by this specification. Room photographs and descriptions remain as marketing content only.

CHAPTER 02 / V-FARMS PRODUCT BLUEPRINT

Decisions, assumptions and scope

Distinguish confirmed business facts from proposed MVP defaults.

STATUS	ITEM	V1.1 DECISION
Confirmed	Reservation unit	One exclusive five-acre resort; includes the single five-room guest building.
Confirmed	Reservation products	Whole-estate stay and exclusive event.
Proposed	Stay purchase	Instant booking + online deposit/full payment where owner publishes rates.
Proposed	Event purchase	Enquiry → owner quote/approval → payment → confirmation. No public instant event checkout.
Proposed	Event exclusivity	Events occupy the entire property, with dates closed to other stays/events.
Proposed	Event/day conflict rule	An event date cannot share a date with an active stay, including arrival or departure; exception workflow deferred.
Open	Stay times, event hours, capacity	Owner will configure and approve actual values and event limits.
Open	Commercial policy	Stay/event prices, taxes, deposits, cancellation policy and security deposits TBD.

MVP boundaries

Included: premium responsive website; five-room showcase; farm map; stay availability; event enquiry/quotes; payments; admin calendar and CRM; transactional email; pricing/policy management; audit logs; deployment and operational validation.

Later: room-by-room sales; OTA channel management; mobile apps; complex memberships; food POS; in-house event planning suites; event time-slot coexistence; automated WhatsApp campaigns; multi-property franchise.

All example room names, images, capacities, tariffs and map placements must be labelled as placeholders until supplied and approved by the owner.

CHAPTER 03 / V-FARMS PRODUCT BLUEPRINT

Brand experience and creative direction

Premium botanical design anchored in the real farm, not a generic hotel.

ELEMENT	DIRECTION
Brand positioning	"V-Farms — a private five-acre nature escape." Refine positioning after verifying actual amenity offering and exact location.
Visual language	Modern botanical luxury; warm ivory surfaces, deep forest green, rich earth colors, restrained dragon-fruit pink accents, generous whitespace.
Typography	Refined editorial headings paired with a highly legible body font; strong mobile hierarchy.
Photography	Actual aerial farm shot, guest building, each of five rooms, plantation by season, verified experiences, authentic local setting.
Movement	Subtle image transitions and scroll reveal only; support reduced motion and fast loading.
Hero CTA	**Book Entire Resort** and **Plan an Event**. Never "Book This Room."
Trust	Accurate capacities, inclusions, check-in policies, verified guest reviews, clear address/directions and accessible contact.

Mobile-first page hierarchy

01 Inspire	02 Explore	03 Choose	04 Confirm

- Use a sticky mobile bottom bar showing the active **Stay** or **Event** action.
- Provide accessible date controls and readable INR totals; avoid hidden fees or deceptive scarcity.
- Use "Five distinct rooms, one exclusive booking" on room pages to remove ambiguity.

CHAPTER 04 / V-FARMS PRODUCT BLUEPRINT

Public website pages and content model

Every public page must have a measurable purpose and an owner-editable content source.

PAGE	REQUIRED CONTENT / BEHAVIOR
Home	Cinematic hero, exclusive-resort proposition, stay/event entry points, farm story, social proof, directions.
About V-Farms	Founder/farm story, dragon fruit cultivation, property rules, actual facilities.
The Five Rooms	Room cards showing individual size/view/bed/photos/facilities; one notice that all rooms are included in whole-property stay.
Explore the Estate	Interactive five-acre map with actual zones, single building and approved pathways.
Stays	Dates, number of guests, inclusions, capacity, property-wide pricing and booking CTA.
Events	Supported event types, policies, event form, custom quote workflow and photos.
Experiences	Seasonal farm activities and curated services only when actually offered.
Gallery	Optimized real photos, short videos, attribution/usage rights.
FAQs & Policies	Capacity, dates, check-in/out, catering, noise, pets, deposits, cancellations, event conditions.
Contact / Directions	Verified address, maps link, phone, WhatsApp link, support hours, contact form.
Legal	Privacy, terms of stay, event terms, cancellation/refunds, payment disclosures and accessibility contact.

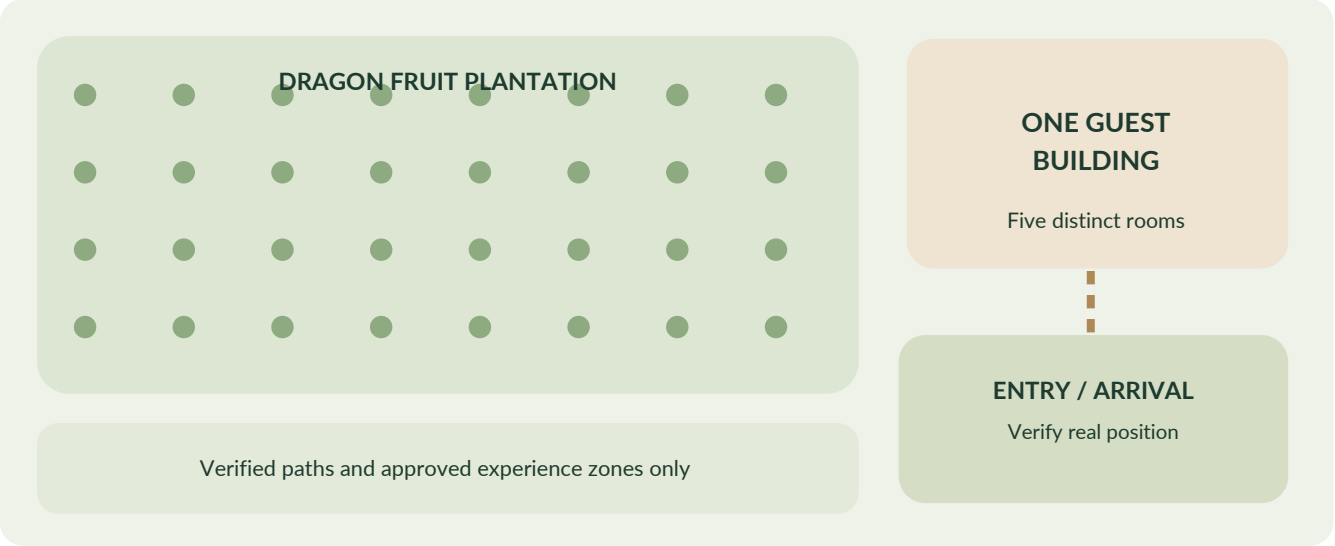

Content admin requirements

Non-developer admin should edit hero text, galleries, farm content, FAQ, amenity flags, published stay tariffs, event categories and policy versions without changing source code. All photos and facility promises require owner approval.

CHAPTER 05 / V-FARMS PRODUCT BLUEPRINT

Five-acre interactive estate map

Design for discovery while avoiding invented site geography.

Schematic only. Actual boundaries, orientation, trails, building, plantation zones, access routes and facilities must come from owner-supplied drone imagery or surveyed layout.

Interactive hotspots

ZONE	TAP / CLICK EXPERIENCE
Accommodation building	Exterior imagery; all five room stories; included-with-stay notice.
Dragon fruit cultivation	Farm facts, seasonal visuals, plant lifecycle, restricted-area guidance.
Paths and farm walk	Verified route, access notes, duration if measured, safety instructions.
Arrival and parking	Actual check-in point, parking guidance, accessible arrival details.
Guest/event facilities	Show only verified lawn, seating, dining or event zones with permitted capacities.

Validation rules

- A map hotspot cannot claim a pool, cafe, wedding lawn or activity unless confirmed as existing and available.
- Map remains understandable on mobile and keyboard-accessible; fallback static map and text list are provided.
- Property boundary is approximate unless based on a surveyed plan; no invented walk times.

CHAPTER 06 / V-FARMS PRODUCT BLUEPRINT

Stay booking: end-to-end guest journey

One overnight reservation buys exclusive resort access, not a subset of rooms.

STEP	GUEST EXPERIENCE	SYSTEM REQUIREMENT
1. Search	Select check-in, check-out and guest count.	Use Asia/Kolkata; validate dates, published capacity and minimum stay.
2. Availability	See one availability result: V-Farms available or unavailable.	Single property calendar reconciles stays, event holds and admin blocks.
3. Details	Explore all five included rooms, amenities and policies.	Do not expose individually reservable rooms or rates.
4. Price	Show per-night resort tariff, date breakdown, extras, taxes and total.	Recalculate securely before holding or paying.
5. Reserve	Collect booker/guest count, contact, policy acceptance.	Create expiring property-level hold only if no conflict.
6. Pay	Pay configured full amount or deposit via Razorpay.	Never accept browser-only “payment success” as confirmation.
7. Confirm	Show reference, payment status, dates, rules and receipt/next steps.	Send email; booking state reflects verified payment and reserved inventory.

Stay quote details

- One whole-property base price per night; adjustable weekday/weekend/holiday and seasonal rate plans.
- Configurable minimum/maximum nights, adult/child counts, max total guests and included occupants.
- Optional paid add-ons (for example meals or activities) only if the owner offers them.
- Policies: arrival/departure times, guest ID process if legally required, quiet hours, visitor rules and damage/security deposit terms.

CHAPTER 07 / V-FARMS PRODUCT BLUEPRINT

Event booking: end-to-end guest journey

Exclusive event use requires qualification and owner approval in the MVP.

STEP	GUEST EXPERIENCE	SYSTEM REQUIREMENT
1. Explore	See eligible event types, venue photos, rules and exclusions.	Events listed only when legally and operationally approved.
2. Enquire	Select event date(s), type, time preference, expected attendees.	Use configurable capacity; do not show unverified maximum occupancy.
3. Add needs	Request rooms for organizer use, catering, decor, vendors, setup.	These are enquiry requirements, not automatically guaranteed inclusions.
4. Review	See “request received / quote pending,” not booking confirmed.	Unapproved enquiries do not silently block public inventory.
5. Quote	Admin checks feasibility, sends dated quote and written conditions.	Quote has expiration, inclusions, extra charges, optional damage deposit.
6. Approve/pay	Customer accepts event terms and pays reservation deposit.	Atomic hold and verified payment required before confirmation.
7. Prepare	Receive agenda and operational checklist.	Owner assigns vendor approvals, event timing, guest/vehicle limits.

Important event distinctions

Event reservation still books the entire estate. Five rooms are part of the estate, but overnight occupation, bedding access and late checkout must be explicitly stated in the event package or custom quote; they must not be presumed.

MVP SAFETY DECISION

All approved event dates block whole-property stay bookings. Day-part sharing (such as morning event + evening stay) is deferred until reliable setup, cleaning and turnover rules exist.

CHAPTER 08 / V-FARMS PRODUCT BLUEPRINT

Availability and booking-conflict policy

This is the most important backend correctness requirement.

RULE ID	NON-NEGOTIABLE BUSINESS RULE
INV-01	There is one sellable inventory entity: the entire V-Farms property.
INV-02	A confirmed stay cannot overlap another stay in booked nights.
INV-03	An event date cannot overlap any confirmed stay, existing event, active property hold or maintenance closure.
INV-04	By conservative MVP rule, an event also cannot use a stay arrival or departure date.
INV-05	Back-to-back stays may occur on the same checkout/check-in date when turnover is operationally allowed.
INV-06	Availability check, quote amount and reservation hold must be validated atomically at the database level.
INV-07	A payment that succeeds after a hold expires must not auto-confirm the now-unavailable property. Escalate for resolution/refund.
INV-08	Soft enquiries never create hard holds. Owner-controlled temporary holds must expire automatically and be visible in admin.
INV-09	Admin blocks and events obey the same central conflict policy as public stays. No hidden bypasses.

Working examples

SCENARIO	EXPECTED RESULT
Stay Fri → Sun; event Sat	Rejected: event conflicts with an occupied date.
Stay Fri → Sat; event Sat	Rejected under conservative event turnover policy.
Stay Fri → Sat; next stay Sat → Sun	Allowed if no event/closure and same-day stay turnover is enabled.
Two guests click Pay for the same weekend	One active valid property hold at a time; second is not allowed to pay that slot.
Unpaid hold expires; slot resold; late capture arrives	Do not confirm old reservation; flag exception and initiate controlled remedy.

CHAPTER 09 / V-FARMS PRODUCT BLUEPRINT

Pricing, packages and commercial policies

Transparent, configurable pricing for two different reservation products.

FIELD	WHOLE-RESORT STAY	EXCLUSIVE EVENT
Primary unit	INR / night for the entire property	INR / event or day (custom quotation)
Variables	Weekend, peak season, holidays, min nights	Event type, expected guests, duration, setup, extras
Payment	Full or deposit, configured by owner	Quoted deposit; balance schedule
Add-ons	Offered meals and experiences	Catering, AV, decor, staffing as approved
Security deposit	Policy-controlled if applicable	Policy-controlled if applicable
Taxes	Itemized applicable taxes	Itemized applicable taxes
Cancellation	Published stay policy, versioned	Accepted event agreement, versioned

Admin-facing commercial controls

- Daily stay rate calendar, exception prices, closed-to-arrival dates and advance-booking window.
- Event package templates and private custom quotes, including optional non-refundable or refundable lines subject to law and disclosed terms.
- Discount codes or negotiated rates only with audit trails and expiry.
- Quote validity, deposit deadline, balance-due reminders, manually recorded offline payments and invoice/receipt numbering.
- Do not hardcode GST rates; confirm applicable tax classification, thresholds and invoicing with a qualified local tax advisor.

Sample booking summary format

Whole V-Farms resort | 2 nights	INR amount determined by published rate rules
Taxes, optional services, refundable deposits	Each item independently displayed
Amount due now / balance due later	Clearly distinguish deposit from total

CHAPTER 10 / V-FARMS PRODUCT BLUEPRINT

Reservation states and lifecycle

A clear state model avoids both false confirmations and trapped inventory.

OBJECT	ALLOWED STATES / EXPECTED TRANSITIONS
Stay	Draft → Held (expiring) → Awaiting payment → Confirmed → Checked in → Checked out; cancellation/expiry paths separately recorded.
Event	Enquiry → Review → Quote sent → Customer accepted → Held/awaiting deposit → Confirmed → Completed; declined/expired/cancelled paths.
Payment	Created → Pending → Authorized/Captured or Failed; refund-requested/partial-refund/refunded where applicable.
Inventory hold	Active → Released, Converted to confirmed, or Expired.
Admin closure	Configured window with reason, owner identity and timestamp; removable with audit entry.

State and timing rules

- Hold duration is a configurable MVP default (proposed 15 minutes); expiry is enforced during every availability transaction, not only by scheduled cleanup.
- Server-generated reference and price snapshot persist the commercial terms accepted at checkout.
- A quote acceptance never guarantees the date until the system successfully acquires a valid property hold.
- Status changes happen through approved transitions only; admins cannot set “paid” without a recorded method/reference.
- All event/stay modifications trigger a conflict recheck and record who changed the booking.

Customer notifications

Send transactional email for enquiry receipt, quotation, payment request, verified booking confirmation, cancellation/refund outcome and pre-arrival logistics. Configure deliverability, retry rules and operational alerting. WhatsApp templates and automation are phase two unless an approved provider is connected.

CHAPTER 11 / V-FARMS PRODUCT BLUEPRINT

Razorpay payment and reconciliation

Protect both the customer's money and V-Farms inventory.

CONTROL	ACCEPTANCE REQUIREMENT
Gateway order	Create payment order server-side from immutable quotation/booking amount snapshot and active hold.
Secure secrets	Razorpay secret keys and webhook secret live only in secure server environment variables.
Verification	Verify checkout authenticity and webhook signatures; confirm only a valid captured/paid state.
Duplicates	Deduplicate webhook events; repeated or out-of-order events never double-confirm/refund.
Delayed events	Account for failed callbacks, later settlement and expired holds without corrupting inventory.
Reconciliation	Daily compare V-Farms captured payments, gateway transactions, refunds and booking status.
Refunds	Admin-only refund initiation/recording, reason, approver, gateway reference and guest notification.
Payment modes	India-ready UPI/cards/netbanking where merchant account supports; test each intended method.
Failure handling	No booking promise on cancelled checkout, failed payment or network timeout; provide status lookup.

PAYMENT CONFIRMATION INVARIANT

"Thank you" pages are not financial evidence. A reservation becomes confirmed only after a valid inventory claim and verified payment or an owner-authorized offline/manual process.

Operational exception queue

List "paid but not booked," "booking confirmed but payment unresolved," "partial refund," "duplicate callback" and "reconciliation mismatch." Assign owners, timestamps and expected resolution. Do not silently swallow payment exceptions.

CHAPTER 12 / V-FARMS PRODUCT BLUEPRINT

Admin dashboard specification

A practical daily operations console for a single small luxury property.

MODULE	MVP CONTROLS
Overview	Today arrivals/departures, active stays, upcoming events, pending quotes, payment exceptions.
One master calendar	Whole-estate stays, events, quotes, holds, blackouts; filters and monthly/list views.
Stay reservations	Guest profile, dates, amounts, ledger, policy snapshot, confirmation, cancellation.
Event enquiries	Pipeline status, intended event type, attendance, requirements, quote, contracts, deposit.
Pricing & packages	Stay nightly rules, event templates, special rates, taxes and configurable deposits.
Operations	Check-in/out tasks, maintenance closures, cleaning/turnover, event setup and vendor notes.
Payments	Gateway status, pending balances, offline payment logs, refunds, reconciliation exceptions.
Content & estate map	Room photos/descriptions, map hotspot approvals, experiences, policies, FAQs.
Settings	Capacity, hours, buffers, notification templates, access roles, booking windows, time zone.
Audit & reports	All booking and money changes; occupancy, stay nights, event bookings and revenue.

Admin role boundaries

Owner/admin: all permissions; **Reservations:** enquiries, calendar and quotes; **Operations:** assigned schedules and guest arrival data; **Content:** public editorial changes. Refund rights, gateway settings and deleting sensitive records stay restricted to explicitly authorized roles.

CHAPTER 13 / V-FARMS PRODUCT BLUEPRINT

Information architecture and data model

Conceptual entities, relationships and ownership. No code or database syntax.

ENTITY	MINIMUM INFORMATION
Property	V-Farms identity, location, amenities, max capacities, policies and booking settings.
Room profiles (5)	Name, size, bed type, view, actual photos, amenities; informational only, not inventory.
Property calendar	Time/date reservations, stays/events, closures, holds, buffers and status.
Stay bookings	Dates, party size, guest details, package, amounts, versioned terms and status.
Event enquiries/quotes	Date, event type, attendance, organizer, custom requirements, quote revisions/acceptance.
Rate plans & line items	Stay daily rates, event packages, seasonal exceptions, add-ons, taxes and deposits.
Payments & refunds	Internal booking/quote reference, gateway identifiers, verified status and reconciliation.
Customer records	Contact, consent, limited guest/organizer details, permitted requests and communication history.
Media, map, CMS	Published text, asset permissions, map zone locations and content approval status.
Admin users & audit	Role, MFA status, actions, old/new booking or pricing state and time of change.
Notifications	Event type, template, delivery status, retry count and error.

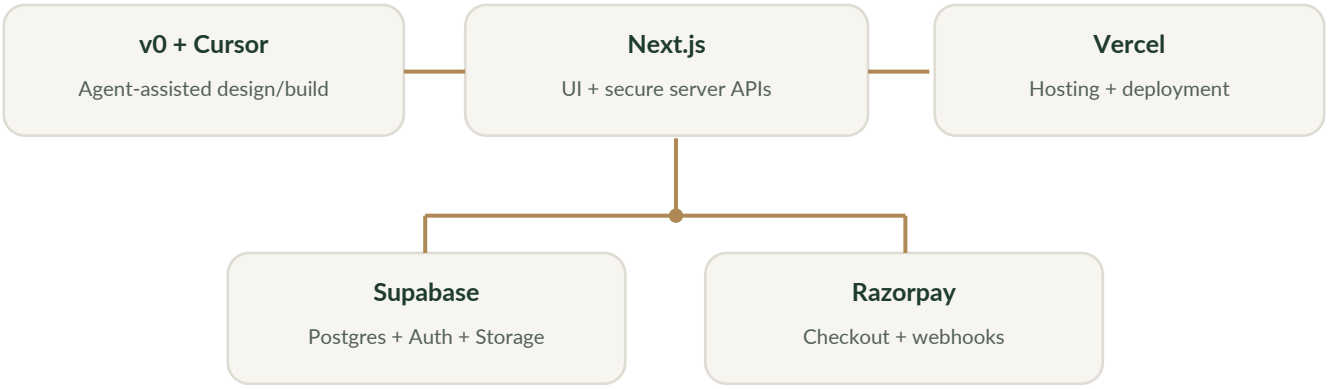

Design constraints

- Use an immutable property ID shared across every availability check and booking; no separate saleable room IDs.
- Keep financial amounts and taxes on a locked booking/quote snapshot for auditability.
- Every payment event has a unique event identity, processing state and linked order reference.
- Use controlled access to personally identifiable information; collect only needed data.

CHAPTER 14 / V-FARMS PRODUCT BLUEPRINT

Technology architecture and division of labor

Required stack: v0 + Cursor + Next.js + Supabase + Razorpay + Vercel.

COMPONENT	ACCOUNTABILITY
v0	Generate and refine premium UI concepts and accessible public/admin layouts.
Cursor agents	Implement and review app behavior, tests, database migrations and deployment workflows.
Next.js	Public pages, SEO, admin app, secure server-side booking/payment API and confirmation views.
Supabase	Managed Postgres as inventory source of truth; Auth for staff; Storage for media; RLS.
Razorpay	Payment checkout/orders, captured-payment verification, webhook and refund processing.
Vercel	Builds, preview deployments, production hosting, TLS, managed environment variables, logs.

Additional lightweight services recommended

- A transactional email provider (such as Resend, Postmark or AWS SES) for confirmations and quote notifications.
- Error tracking and uptime alerting (for example Sentry plus an uptime service); analytics respecting applicable privacy rules.
- GitHub repository with branch protection, CI test gates and preview/production separation.
- Secure image transformation/delivery through the selected platform and carefully managed original media backups.

CHAPTER 15 / V-FARMS PRODUCT BLUEPRINT

Security, privacy, compliance and reliability

Guardrails for a real hospitality operation in Hyderabad.

CATEGORY	MINIMUM REQUIREMENT
Identity & access	Supabase Auth for staff; owner MFA; RBAC, session expiry and login rate limiting.
Database	RLS on exposed tables, least privilege, server-only privileged keys, row ownership enforcement.
Transactions	Atomic property-level holds, conflict protection and idempotent webhook events.
Data handling	Encrypt in transit, minimize guest PII, defined retention/export/delete process, restricted uploads.
Threat controls	Validate form input, prevent spam, CSRF/authorization review, secure headers, abuse throttling.
Resilience	Automated monitored backups, separate media backups and documented restore drills.
Operations	Staging environment, traceable deploys, error alerts, incident log and rollback process.
Performance	Target Core Web Vitals “good” at 75th percentile: LCP ≤2.5s; INP ≤200ms; CLS ≤0.1.
Accessibility	Keyboard usable, labeled controls, sufficient contrast, alt text and WCAG 2.2 AA target.
Legal checks	Validate Telangana hospitality/event permits, fire safety, noise/time limits, food licenses if catered, tax/GST, consumer refund rules and music permissions.

Recovery objectives - to approve

Suggested initial operating objectives: **RPO under 1 hour** for paid bookings (only if PITR or equivalent backup plan is purchased and tested) and **RTO under 4 hours** for core booking availability. A daily backup by itself does not satisfy the proposed RPO. Supabase database backups do not include original Storage files; maintain separate media backups.

These are design targets, not vendor guarantees or legal advice. A locally qualified adviser and the owner must confirm permits, licenses, taxation, operating limits and accepted terms before launch.

CHAPTER 16 / V-FARMS PRODUCT BLUEPRINT

Automated validation: property and guest flows

Release-blocking test cases for the corrected exclusive booking model.

ID	GIVEN / WHEN	EXPECTED RESULT
G01	Visitor opens any of five room profiles.	Only resort-wide CTA; no individual-room reservation path.
G02	Visitor selects available dates for whole-resort stay.	One inventory result and complete INR property price.
G03	Two visitors concurrently reserve same nights.	At most one valid active property hold/confirmation.
G04	Confirmed stay overlaps another stay.	Second request rejected, including admin path.
G05	Stay Fri-Sat then stay Sat-Sun.	Allowed if turnover configured and no event/closure.
G06	Event on existing stay arrival/departure date.	Rejected under conservative event policy.
G07	Multi-day event conflicts with overnight stay.	No payment or confirmation of conflicting booking.
G08	Unapproved event enquiry submitted.	Enquiry recorded; no hard inventory block.
G09	Event quote accepted after date is taken.	Cannot acquire hold; show unavailable and escalate.
G10	Active hold expires before payment.	Inventory released; old session cannot auto-confirm.
G11	Guest count exceeds configured property capacity.	Cannot request instant stay payment; clear warning.
G12	Guest changes stay dates after price displayed.	Total recalculated; final payment amount server-derived.
G13	Owner blocks property for maintenance.	Dates unavailable to stays and event approvals.
G14	Search spans seasonal rate boundary.	Each night priced using proper rate version.
G15	Small mobile screen / keyboard user searches dates.	Controls and error messages usable and visible.

Priority: All cases G01-G14 are P0 for reservation correctness; G15 is P1 user experience. QA produces linked automated tests plus signed manual browser evidence.

CHAPTER 17 / V-FARMS PRODUCT BLUEPRINT

Automated validation: payments and admin

Negative-path tests are just as important as successful checkout.

ID	TEST CASE	REQUIRED OUTCOME
P01	Valid payment captured on active hold.	Single confirmed stay/event and one receipt.
P02	Checkout screen claims success without verified proof.	No confirmed reservation.
P03	Razorpay webhook has invalid signature.	Reject and alert; no inventory state change.
P04	Same webhook delivered repeatedly.	Exactly-once business effect; duplicate logged.
P05	Payment events arrive out of order.	Correct final status; no backward transition.
P06	Payment captured after hold has expired and sold.	Flag paid-unbooked; manual resolution, never double-book.
P07	Gateway shows captured but app shows pending.	Reconciliation detects mismatch and opens exception.
P08	Refund partially completed.	Amount/balance/status correct; customer informed.
A01	Unauthorized browser calls admin mutation.	403/denied and no stored changes.
A02	Content editor attempts refund or price override.	Denied by role; audit record where appropriate.
A03	Admin changes event date to occupied day.	Conflict blocked, even in manual console.
A04	Owner edits package price after booking.	Old reservation retains accepted price snapshot.
A05	Payment key accidentally used in frontend.	Static/secret scan fails deployment.
A06	Restore database and media backup in staging.	Recover bookings, assets and reference integrity.
A07	Email provider temporarily fails.	Retry; booking remains correct; visible alert.

Priority: P01-P08 and A01-A06 are P0. A07 is P1 with an owner-visible fallback. Test Razorpay integration using test credentials before enabling live mode.

CHAPTER 18 / V-FARMS PRODUCT BLUEPRINT

Manual UAT and design acceptance

Human sign-off confirms the premium promise, operational realism and clarity.

CHECK	OWNER ACCEPTANCE STANDARD
Luxury visual quality	Photography is real and rights-cleared; cohesive botanical identity; no generic fake facilities.
Room storytelling	Five distinct rooms visibly explained, all included in whole-resort stays; no room-wise rates.
Guest journey	Under 3 main booking screens after date selection; policies/taxes/price visible before payment.
Event journey	Quote request, admin approval, guest acceptance and deposit can be completed with a paper trail.
Farm map	Owner validates actual building, entrance, plantation sections, public/private routes.
Mobile and accessibility	Usable on current Android/iPhone sizes, touch target spacing, keyboard and screen reader smoke test.
Owner operations	Owner can manage 30-day calendar, create blackout, issue quote, confirm offline payment, locate payment exception.
SEO and discovery	Unique titles/meta, local business/contact data, sitemap, robots and clean canonical URLs.
Performance	Audit images, lazy loading, Core Web Vitals field test, minimal layout shift.
Backups & rollback	Restore practice plus a tested deployment rollback before accepting real payments.

Acceptance report format per agent

Each agent hands over: feature ID; requirement summary; scenario/data tested; evidence URL or screenshot; actual outcome; known limitation; security implications; reviewer approval; and deployment environment. Unverified claims must be recorded as **NOT TESTED**, not “done.”

SHIP BLOCKER

Any unresolved P0 overbooking, payment-verification, refund-integrity, unauthorized admin access or missing guest-policy disclosure blocks production launch.

CHAPTER 19 / V-FARMS PRODUCT BLUEPRINT

Agent-driven delivery model

Assign explicit responsibilities, handoff artifacts and independent review.

AGENT / ROLE	RESPONSIBILITY	HANDOFF
Product orchestrator	Own scope, decisions and requirement traceability.	Approved PRD, task dependencies, change log.
Brand/UX agent (v0)	Visual system, guest wireframes, farm map and admin UI.	Responsive screens, design tokens, accessibility notes.
Frontend agent (Cursor)	Next.js page behavior, booking form, SSR/SEO and admin UI.	Reviewed UI implementation and component tests.
Data & inventory agent	Supabase schema, property-level conflict logic, policies, role security.	Migrations, ERD, unit tests and RLS evidence.
Payments agent	Razorpay checkout, webhook, idempotency, refunds, exception queue.	Payment flow/test evidence and recovery runbook.
Operations agent	Admin pipeline, event quotes, guest messaging, audit and exports.	Admin UAT, message templates and permissions test.
QA/security agent	Threat review, acceptance tests, negative cases, performance.	Independent go/no-go findings and sign-off.
DevOps/release agent	Vercel environments, CI gates, monitoring, backups, rollback.	Deployment guide, incident and restore runbook.

Non-negotiable agent instructions

- Before any change, every agent must restate: **“V-Farms is one property-wide booking inventory for both stays and events.”**
- Agents may propose alternatives but cannot silently add individual-room pricing/availability, permit new event categories or invent map coordinates.
- Each task must reference a requirement ID and a proving test; design polish does not override correct booking logic.
- No agent may mark a payment, compliance, capacity or accessibility requirement validated without actual evidence.

CHAPTER 20 / V-FARMS PRODUCT BLUEPRINT

Agent execution sequence and phase gates

A staged build plan that avoids designing the wrong inventory model.

PHASE	DELIVERABLES	EXIT GATE
0. Discovery	Obtain room details, true map/photo assets, guest/event rules, capacity and pricing decisions.	Owner signs assumptions and operating policy.
1. Brand & UX	v0 luxury homepage, rooms, farm map, stay/event journeys, admin screens.	Owner approves mobile/desktop design; no room-wise checkout.
2. Foundation	Next.js project, environments, Supabase schema, Auth, media workflow, CI and RBAC.	Schema review, auth/RLS tests, preview deploy.
3. Inventory	Property-wide availability, holds, blackout, stay price and event quote transitions.	All G01-G14 tests green under concurrency.
4. Payments	Razorpay orders, signatures, webhooks, capture, reconciliation and refunds.	P01-P08 tests green including late payment.
5. Admin & content	Unified calendar, quote desk, operations, CMS, email and audit.	Owner performs operational UAT.
6. Hardening	A11y, Core Web Vitals, security, backup/restore, logs, legal pages, monitoring.	P0 zero; P1 only documented/accepted.
7. Launch	DNS/domain, live merchant credentials, production checks, rollback and hypercare.	Owner signs go-live sheet after end-to-end payment smoke test.

Definition of done

A phase is complete only when its public/admin behavior works in a real preview environment, critical negative-path tests pass, security review is documented, and the owner approves the user-facing outcome. Screenshots alone never establish a working MVP.

CHAPTER 21 / V-FARMS PRODUCT BLUEPRINT

Risks, dependencies and decisions

Resolve these before production money and event reservations are accepted.

PRIORITY	OPEN OWNER INPUT	WHY IT MATTERS
P0	Exact permitted event types and maximum attendees.	Controls safety, legal viability and quote eligibility.
P0	Check-in/out, events hours, event prep/cleanup buffers.	Drives property conflict rules and operational turnover.
P0	Stay inclusion policy for all rooms, bedding and maximum overnight guests.	Defines what “whole resort” legally and commercially includes.
P0	Event overnight-room access and quote inclusions.	Prevents selling overnight accommodation implicitly.
P0	Price lists, payment/deposit schedule, security deposits, cancellation/refund terms.	Needed for valid quotes, checkout and disclosure.
P0	Operating and event permissions, relevant insurance, fire/food/music approvals.	Legal readiness for stays and events.
P0	Razorpay merchant onboarding and settlement/refund setup.	Required to accept production payments.
P1	Exact site map/drone image, property boundaries and actual amenity photos.	Luxury design and truthful map content.
P1	Staff roles, email sender and support escalation contacts.	Operational readiness and safe permissions.
P1	Public domain, brand logo, photo/video rights and local SEO details.	Brand credibility, launch discoverability.

Recommended default choices until owner approval

Use quote-first exclusive events, daytime events blocked by calendar date, stay bookings by overnight nights, conservative event/stay turnover, no paid event booking before approval, secure deposit checkout, and a single master estate calendar. Every default must remain configurable but cannot be weakened without revalidation.

CHAPTER 22 / V-FARMS PRODUCT BLUEPRINT

Production readiness and go-live checklist

The final owner-level validation gate before accepting the first reservation.

DOMAIN	MUST BE VERIFIED / EVIDENCE
Product truth	V-Farms identity, actual room facts, event rules, map and approved copy.
Correct inventory	Single exclusive estate; all stay/event overlap scenarios and hold expiry pass.
Payments	Live account onboarding, permitted payment methods, test-to-live config, signed webhook and reconciliation.
Legal & policies	Approved guest/event terms, invoice/tax treatment, cancellation, privacy and required permits.
Security	Admin MFA, RBAC/RLS review, secret scanning, abuse protection, basic penetration testing.
Operations	Calendar/quote desk staffed, event checklist, refund procedure and incident owner.
Notifications	Email sender/domain verification, booking and quote templates and failure escalation.
Reliability	Backup/restore rehearsal, media backup, error monitoring, alerting and rollback.
UX & performance	Mobile usability, accessibility smoke test, cross-browser results, SEO and CWV targets.
Production validation	One controlled successful live test transaction and reversal/refund under merchant rules; all evidence archived.

Release sign-off (to be completed by the team)

SIGN-OFF ROLE	DECISION / RECORD
Product owner	Approve scope, rates, booking terms, room content and event policy.
Engineering owner	Confirm P0 tests, deployment, inventory protection and payment safety.
Operations owner	Confirm admin workflow, guest messaging and recovery procedures.
Compliance/tax reviewer	Confirm local licenses, guest/event restrictions, refund and invoicing treatment.

CHAPTER 23 / V-FARMS PRODUCT BLUEPRINT

Reference documentation and assumptions register

Verified platform references. Source and product rules were reviewed on 12 October 2026.

OFFICIAL REFERENCE	PURPOSE / URL
Next.js authentication	Authorization requirements for route handlers and server actions. https://nextjs.org/docs/app/guides/authentication
Next.js production checklist	Security, performance, accessibility and deploy considerations. https://nextjs.org/docs/app/guides/production-checklist
Supabase production checklist	RLS and security checks before public launch. https://supabase.com/docs/guides/deployment/going-into-prod
Supabase database and backups	Managed PostgreSQL; note backup and Storage limitations. https://supabase.com/docs/guides/database/overview
Supabase secure data	Exposed table RLS and backend-only secrets. https://supabase.com/docs/guides/database/secure-data
Razorpay Orders	Orders and captured payments. https://razorpay.com/docs/api/orders/
Razorpay webhook practices	Signature verification, duplicate and out-of-order event handling. https://razorpay.com/docs/webhooks/best-practices/
Vercel Functions	Server-side function deployment and behavior. https://vercel.com/docs/functions
v0 platform	AI design/build and Vercel project integration. https://vercel.com/docs/v0

Scope-control record

Version 1.1 change: Replaces earlier room-by-room reservation models with one exclusive whole-property inventory. Adds separate stay and event booking journeys, event enquiry/approval, single master estate calendar, event-date collision rules and revised agent/QA acceptance criteria.

V-Farms site facts come from the owner. Proposed business defaults are identified as such and should be approved prior to execution. This document is a build specification and validation plan; it does not certify that a production application or live payments have been delivered.
